- Any logic of marketing interactions with customer (SMS, Email, Popups, Banners)
- Wide range of products filtering conditions
- Wide range of customer conditions
- Wide range of customer purchases history conditions
- Possibility for AND/OR/NOT conditions combinations (logical expressions)

## Refund System with RMA

- **Refund**

The merchants can make the settings to allow customers to submit a **refund request**. Once the refund request is accepted then the merchants can proceed the refund procedure. The buyers can send **multiple refund requests** within the allowed days even if any request is already processed. It means the user can send a refund request for an ordered product multiple times even if any of the previous refund request is processed.

- **Exchange**

The customer can submit an **exchange request** on multiple products or for an order product, and a new order is generated for the exchanged product. If the exchange amount exceeds the new product amount then default payment method is used for the payment of the **extra amount**. The user can send multiple exchange requests up to the available days and if any request is already processed. It means the user can send an exchange request for an ordered product multiple times, even if any of the previous return request is processed.

- **Add Custom Status To Mark Your Progressing Refund and Exchange Process**

Refund or exchange is achieved in multiple steps. The refund and exchange allow merchants to **set the custom status for each step**. Some

common status includes — refund-requested, refund-approved, refund-canceled, exchange-requested, exchange-approved, exchange-canceled, etc.

When a buyer requests a refund on a product then order status becomes “Refund Requested”. And, when the refund request is approved then order status changes to “refund approved” or when the refund request is canceled then order status becomes “refund canceled”. Similarly, other status can be set accordingly by the merchants as per their convenience.

- **Availability**

Refund and exchange feature is available up to a certain number of days when the order is completed. When the order status is completed then the user is able to send a refund and exchange request. If anyone of the requests is in the process then another request can't be sent. It means both refund and exchange requests for an order are not placed simultaneously for an order.

- **Tax Handling**

The merchant can **include the tax** in the refund amount. If the include tax setting is enabled then the user can refund or exchange products with tax included product price. If a merchant disables “include tax” setting then tax price is not calculated in a refund as well as exchange.

Include tax setting is separate for both refund and exchange process for RMA.

- **Auto Accept Refund Request**

If a merchant wants to **auto accept the refund request** then can enable it from the setting option in the . With auto accept, when the user requests for any product refund, the request is automatically approved and the merchant gets a notification email regarding that refund request, to proceed the refund payment process.

- **Refund/Exchange for Guest User**

Return and exchange requests can be submitted by both; guests as well as registered users. There is a page created with name Refund/Exchange Request on extension activation, where the guest user enters their order id and email address and proceeds with refund/exchange request.

- **Handling Fee**

The merchant can add handling fees for both refunds as well as exchange request. This fee may be inventory management fee, shipping fee, etc., according to the admin.

- - **Minimum Order Amount**

Merchant can set the minimum order amount, as a threshold amount. Any order below this amount cannot request for refund and exchange.

- - **Sales Items**

This feature prevents sale items from the refund and exchange request. If this feature is enabled then the customer can't send the refund or exchange request for sale items.

- - **Email Notification** The merchant can also customize user notification email from the backend. Notification include:

- Refund request sent notification
- Refund request received notification
- Refund request approved notification
- Refund request canceled notification
- Exchange request sent notification
- Exchange request received notification
- Exchange request approved notification
- Exchange request canceled notification

- - **Product Disable**

The merchant can disable refund and exchange features on any chosen product. There is an option in the Advanced Setting section on the product edit page to disable refund and exchange for that product.

- - **Category Disable**

The merchant can remove the option of refund and exchange request from any specific product category by disabling it in the backend setting.

- - **Multiple Request Handling**

The merchant can enable/disable multiple refunds or exchange requests for an order. If a merchant disables Multiple Request handling then either refund or exchange request is processed for an order at a time.

- - **Manage Stock**

The merchant can manage the stock of the returned or exchanged product when a request is completed. If the setting is enabled then an exchanged or refunded product is added to product stock

- - **Custom CSS**

The merchant can add custom CSS to modify the refund and exchange request form if required.

- - **Customer Wallet**

The merchant can enable this feature to send the refund amount into the customer wallet, instead to refund the amount with other gateways.

- - **Wallet Payment**

Add the customer's wallet as a payment gateway to make payment for any purchases.

- - **Manage Customer Wallet**

Manage the customer wallet from the customer edit page.

- - **Shortcode for Customer Wallet**

Add a shortcode to display the Customer Wallet on any desired page.

- - **Cancel Order**

Merchants can add cancel order features to their store. Using this feature of the , customers can cancel the ordered products which they no longer need.

- - **Catalog Settings**

Catalog settings allow merchants to group products based on timely requirements such as during festive days, merchants can set catalog of

products for festivals and frame a common refund and exchange policy for that.

- - **Send Return Ship Label**

With this setting enabled, merchants can send return ship labels to the customer for return shipping of the product(s). Merchants can also create ship label templates using shortcodes.

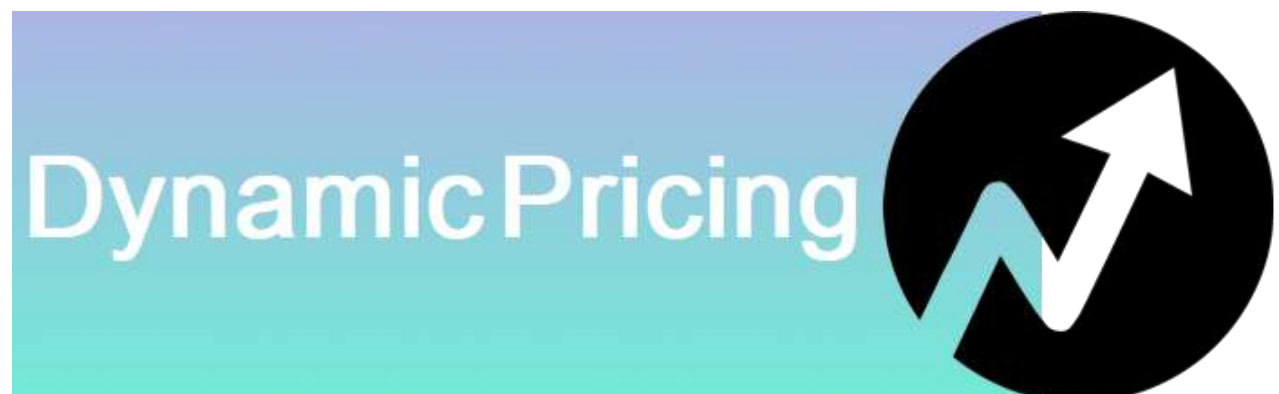

- - **Refund Policy** Merchant can enable this feature and set their refund policy in two way with this RMA
    - Price based policy
    - Time based policy

- - **Enable Exchange Request With Same Product or its Variations**

Now buyers can exchange their ordered product with the same product and it's variations.

- - **Custom Email Template for Refund**

Now you can also send a well customized email using a custom email template for during refund and exchange
